Demographic Estimating Conference

July 11, 2023

Tallahassee, FL

Estimates Evaluation for April 1, 2020

Age, Sex, Race, and Hispanic Origin

BEBR County Model, BEBR State Model, NCHS Estimates

Precision:

- Mean Absolute Percent Error (MAPE)
- Median Absolute Percent Error (MedAPE)

Bias:

- Mean Algebraic Percent Error (MALPE)
- Median Algebraic Percent Error (MedALPE)

Table 1. Bias and Precision: Age and Sex, Total Population, State

Age Group	Percent Error								
	Both Sexes			Males			Females

Conclusions and Recommendations

The accuracy of the population estimates for April 1, 2020, by age, sex, race, and Hispanic origin was largely as expected.

Estimates made with the BEBR county model were on average more accurate than those made with the BEBR state model; the NCHS estimates were similar in accuracy to those of the BEBR county model.

Going forward, we will use a total population model by single year of age and sex for the state projections.

For the county model, we will update the cohort-change ratios once the modified race data are available. We will look for ways to update the child/woman ratios more frequently throughout the decade.

Population Estimates Comparison, April 1, 2022, BEBR vs. U.S. Census Bureau

The Bureau of Economic and Business Research (BEBR) and the U.S. Census Bureau (USCB) produce population estimates for counties and subcounty areas (incorporated places such as cities, towns, villages; and unincorporated areas) in Florida each year. While the BEBR estimates are for April 1, the USCB estimates are for July 1. To make the analysis more meaningful, both estimates were compared for a common date, April 1, 2022. The USCB estimates were converted to April 1, 2022 by taking three quarters of the July 1, 2021 to July 1, 2022 population change and adding this change to the July 1, 2021 estimate. While not a perfect comparison, it is preferable to comparing the original estimates that are three months apart.

Table 1 provides a comparison of the BEBR and the USCB estimates for April 1, 2022 at the county level and for the state overall. In addition to the two estimates, the table also shows the numeric and percentage difference between the two estimates. For the state overall, the BEBR estimates were about 135,000 higher than the USCB estimates, a difference of 0.6%. For 36 counties the BEBR estimates were lower than the USCB estimates, and for 31 counties the BEBR estimates were higher. The differences ranged from -12,331 for Lee County to +84,609 for Miami-Dade County. In percentage terms, Walton (-3.6%) and Hernando (-3.0%), and Miami-Dade (+3.2%), Liberty (+4.0), and Gulf (+5.6%) counties showed the greatest differences.

Table 2 compares the numeric and percentage differences between the BEBR and the USCB county estimates for April 1, 2022 for four population size and four population growth rate categories. The table displays differences calculated with the mean as well as the median. Population size was measured as of April 1, 2020; the rate of population growth refers to the period April 1, 2010 to April 1, 2020. The table shows that the BEBR estimates for counties in the

smallest population size category were on average higher than the USCB estimates, while the opposite was true for counties in the two middle population size categories. For the largest size category, the BEBR estimates were somewhat higher using the mean, but according to the median the two sets of estimates were very similar. With respect to population growth, the BEBR estimates were slightly higher for counties in the two lowest growth categories, and somewhat lower for counties in the highest growth category. While the mean-based numeric differences were positive for counties that grew between 10% and 20%, the median was close to zero, as were the percentage differences. Across all counties, the BEBR estimates were on average higher by 2,022 persons or 0.1% according to the mean-based measure; the median differences were very small. Overall, the data in Table 2 suggest that the two sets of estimates were quite similar for April 1, 2022.

Table 3 is structured analogous to Table 1, but shows the BEBR and the USCB population estimates, as well as the numeric and percentage differences between them, for all subcounty areas – including incorporated places and unincorporated areas – in Florida. For 199 subcounty areas the BEBR estimates were lower than the USCB estimates for April 1, 2022, for 2 subcounty areas the two sets were identical, while for 280 subcounty areas the BEBR estimates were higher. For about half (49%) of all subcounty areas the differences between the two sets of estimates amounted to fewer than 100 persons. The differences were greatest for the unincorporated areas of Pasco (-9,566), Sumter (-8,058), Lee (-7,776), St. Johns (-6,714), and Hernando (-6,189) counties, and for the unincorporated area of Miami-Dade County (+35,610), Jacksonville city (+19,530), the unincorporated area of Orange County (+18,944), Miami city (+11,589), and the unincorporated area of Hillsborough County (+9,569). In percentage terms, for 165 subcounty

areas the BEBR and USCB estimates were less than 1% apart; for 55 subcounty areas the differences exceeded 5%. Subcounty areas with the largest percentage differences mostly had small populations.

Tables 4 replicates the population size and growth rate analysis shown in Table 2, but this time for subcounty areas. Subcounty areas were classified into four population size and four population growth rate categories. Once again, population size was measured as of April 1, 2020, and the rate of population growth refers to the period April 1, 2010 to April 1, 2020. The table shows that for all four population size categories the BEBR estimates were very similar to the USCB estimates, being slightly higher on average. For all subcounty areas, the BEBR estimates on average were higher by 282 persons than the USCB estimates using the mean-based measure, a difference of about 1.2%; the differences were lower for the median-based measure (10 persons, and 0.4%, respectively). In terms of past population growth rates, the BEBR estimates were on average slightly higher than the USCB estimates for subcounty areas in all four growth rate categories, with the median-based measure showing again smaller differences than the mean-based one.

What accounts for the differences between the BEBR and the USCB population estimates for 2022? The BEBR estimates for counties and subcounty areas are produced with a housing unit method, in which changes in population are based on changes in occupied housing units (or households). The USCB estimates for counties, in contrast, are produced with an administrative record-based component of change method, which updates the 2020 census population using data on births, deaths, and domestic and international migration. For the subcounty estimates, the USCB uses updated housing unit estimates to distribute county

population to subcounty areas based on housing unit change. Given that the BEBR and the USCB county estimates are made with different methodologies that utilize different input data, it is not surprising that the resulting estimates sometimes differ.

We like to conclude by noting that although the BEBR estimates were compared to the USCB estimates in this report, the latter represent an alternative set of estimates, not a benchmark along the lines of the decennial census. There exists no "gold standard" against which both sets of estimates can currently be compared; we have to wait for the 2030 decennial census results to make such a comparison. Historically, the population estimates produced by BEBR have been more accurate, on average, than those from the USCB for Florida.

Notes:**All Companies (March):**

The March total has been adjusted downward by 0.373% each year prior to 2020 to make the series comparable to the new Duke data used for the estimates.

The totals for 2020 and 2021 are based on the new Duke data and are about 36,000 –37,000 lower than the EC reports for those years.

The values in the April column for 2020 to 2023 are comparable data for the utilities that have reported their April 1, 2023 to us so far. We are still waiting for data from 8 smaller utilities, representing about 1.5% of all electric customers statewide.

Florida Power & Light:

Data for FP&L raised by 1% prior to July 2013, reduced gradually through December 2013.

Includes City of Vero Beach adjustment, which transferred to FP&L in December 2018 to January 2019.

Duke:

Includes Hardee County adjustment (transfer from Duke to Peace River Electric Coop) through July 2019.

Duke changed their billing system in November 2021. Data for earlier months were inflated due to inclusion of some non-housing units. We lowered the data prior to November 2021 by 13,680 each month to make the series comparable with the new and improved billing system. Also included are updated monthly customer counts since November 2021.

Tampa Electric:

Adjusted data for TECO for January 2017 through April 2018.

Florida Driver's Licenses Issued (Proxy for Domestic and International In-Migration)
